

SHIVAM — PERSONAL PORTFOLIO + BUSINESS WEBSITE

Master Context & Non-Hallucination Specification for Antigravity IDE

Purpose: This document is the source of truth for the website project. Antigravity must preserve this context across implementation work, avoid inventing facts/content, and ask when required information is missing.

1. PRODUCT VISION

The website is not only a developer portfolio. It is Shivam's personal digital headquarters combining a premium personal portfolio, business/service presence, digital-product store, private admin system, and a separate optional Personal Lab for ideas, builds, stacks and thoughts.

The public experience must feel like a premium creative/technology portfolio and business website—not a generic SaaS landing page, generic AI-generated website, or template clone.

2. CORE PUBLIC EXPERIENCE

Primary public navigation should remain simple and frictionless:

Home → About → Projects → Services → Store → Contact

A public visitor must not be forced to create an account or log in merely to view the portfolio, projects, services, store, or public Personal Lab.

3. PERSONAL LAB — SEPARATE OPTIONAL EXPERIENCE

The Personal Lab is intentionally separate from the main portfolio/business journey. It must not be forced on visitors and should be accessible through a subtle entry point or dedicated route such as /lab.

The Lab can contain only information explicitly provided by Shivam. It is a living record of his own ideas, projects/builds, technology stacks and thoughts.

- Ideas: ideas Shivam explicitly shares.
- Builds/Projects: work Shivam explicitly asks to add.
- Stacks: technologies Shivam explicitly associates with an idea/project.
- Thoughts: thoughts Shivam explicitly asks to record.

Hard rule: Never invent, suggest, infer, resurrect, or automatically add random/old projects, ideas, stacks, achievements, metrics, thoughts, services, testimonials, or other personal content. If Shivam has not provided it, leave it empty or ask for the information.

4. DESIGN DIRECTION

Design exploration will use STITCH first. STITCH is for visual direction and UI exploration; Antigravity is responsible for clean, production-quality implementation.

- Premium creative/agency/technology portfolio feel.
- Typography and layout foundation first.
- Custom brand palette; do not default to Tailwind blue/purple or generic AI gradients.

- shadcn/ui may be used as a component foundation, but the final UI must be heavily customized and must not look like default shadcn.
- Strong spacing, typography, composition, contrast and hierarchy.
- 3D and motion enhance the design rather than substitute for good design.
- No generic floating blobs, overused particle backgrounds, stock 3D scenes, or template-like AI visuals.
- The site should feel distinctive and intentionally designed.

5. 3D + MOTION

Technology: Three.js / React Three Fiber for selected 3D experiences; Framer Motion and/or GSAP for motion.

- 3D must be tied to Shivam's personal brand/content and have a reason to exist.
- Prefer one or a few signature interactions over excessive 3D decoration.
- Animations should be choreographed and intentional; do not animate every element with the same fade/slide-up preset.
- 3D scenes must be lazy-loaded and optimized.
- Provide mobile/low-end fallbacks or simplified experiences.
- Respect prefers-reduced-motion.

6. HOME

Home is the primary first impression. It should communicate who Shivam is, what he builds/offers, and provide clear next actions without becoming a resume dump.

- Strong hero typography.
- Clear personal positioning.
- Primary and secondary CTAs.
- Custom, intentional 3D interaction.
- Selected work/business pathways.
- Fast initial render before expensive 3D/media finishes loading.

7. ABOUT

About should communicate the person, builder identity, interests, approach and relevant capabilities. Do not fabricate biography, experience, achievements or claims.

8. PROJECTS + CASE STUDIES

Projects are proof of work and should have dedicated, indexable URLs where appropriate, e.g. /projects/[slug]. A project page can contain overview, problem, approach, architecture, technology, challenges, implementation, results, media and links—but only with facts/content supplied or verified.

The project section should be designed as a strong portfolio/case-study system rather than a generic grid.

Important: do not automatically add any specific project unless Shivam explicitly provides or approves it.

9. SERVICES / BUSINESS

Services are the business/conversion layer. The final list of services must be defined by Shivam. Do not invent services or make unsupported claims.

Each service can communicate what it is, who it is for, what the client receives, process and CTA once Shivam provides the actual offering details.

10. STORE / DIGITAL PRODUCTS

The Store is intended to sell AI agents, design templates and other digital products that Shivam explicitly defines.

Expected purchase flow:

Product → Razorpay Checkout → server-side webhook/signature verification → paid order → secure delivery → email confirmation

- Do not trust a client-side payment success page as proof of payment.
- Digital files should be stored privately.
- Delivery should use short-lived signed URLs where appropriate.
- Do not store unnecessary payment-card/bank credentials.

11. CUSTOMER AUTHENTICATION — IMPORTANT

Public portfolio authentication: none. Visitors must not log in just to browse the site.

Store V1: customer accounts should not be mandatory merely to browse or buy/download a simple digital product. Payment can be tied to a verified purchase/order and delivery can be handled securely.

Hosted AI products: if a future product needs persistent private data, saved conversations, files, settings, or a dashboard, then customer authentication becomes appropriate for that product only.

This creates two separate authentication contexts:

Public website → no login
Private Admin → login required
Optional hosted product → customer login only when genuinely required

12. USER DATA PRIVACY + TENANT ISOLATION

If a future hosted AI agent handles customer data, different customers must be isolated. Customer A must never access Customer B's data.

Expected model:

Tenant A → only Tenant A records/files/settings
Tenant B → only Tenant B records/files/settings

- Use authenticated identity + server-side authorization + Supabase RLS.
- Do not trust a client-supplied tenant_id as the sole authorization mechanism.
- Private storage should use private buckets and authorized access/signed URLs.
- Only store conversations/data when the product actually requires persistence.
- If API keys are stored, never store them as plain text; minimize key exposure and prefer customer-owned provider credentials where appropriate.

13. ADMIN DASHBOARD

The Admin Dashboard is private and requires authentication. It is for Shivam—not for normal portfolio visitors.

Potential management areas:

Projects • Services/content • Products • Orders • Media • Contact enquiries • Personal Lab

Use Supabase Auth and server-side authorization. Database tables must use RLS with explicit policies.

14. TECH STACK

Frontend:

Next.js (App Router) + TypeScript + Tailwind CSS + customized shadcn/ui + Three.js/React Three Fiber + Framer Motion and/or GSAP.

Backend/data:

Next.js Server Actions/Route Handlers where appropriate + Supabase PostgreSQL + Supabase Auth + Supabase Storage.

Security:

Zod validation + Cloudflare Turnstile + Upstash Redis rate limiting + CSP/security headers + HTTPS via Vercel + Supabase RLS.

Commerce/email/deployment:

Razorpay + Resend + GitHub + Vercel + custom domain or temporary vercel.app domain.

15. SECURITY PRINCIPLES

- Never hardcode secrets, tokens or private credentials.
- Validate all external/user input with Zod on the server.
- Use rate limiting on sensitive public APIs/forms.
- Use Turnstile for contact/spam protection.
- Use security headers including an appropriate CSP and X-Frame-Options/frame-ancestors strategy.
- Use RLS on every Supabase table that contains application data.
- Protect admin routes server-side.
- Verify Razorpay webhook signatures before marking orders as paid.
- Use private storage for purchased/private files.
- Do not expose service-role credentials to the browser.

16. PERFORMANCE

The site must feel fast on mid-range Android phones and average mobile networks despite using 3D, animation and media.

- Server Components by default; Client Components only where interaction requires them.
- Lazy-load Three.js/R3F scenes with dynamic imports.
- Optimize GLB/GLTF models; use Draco/Meshopt where appropriate.
- Use next/image and modern image formats.
- Lazy-load below-the-fold images/videos.
- Avoid unnecessary global libraries and excessive client-side JavaScript.
- Prefer transform/opacity animations over layout-triggering animations.

- Avoid multiple simultaneous autoplay videos.
- Provide reduced/simplified 3D for mobile/low-end devices.
- Maintain stable layout and avoid noticeable scroll jank.

17. SEO + ORGANIC DISCOVERY

SEO is a first-class requirement, not a final polish step. The goal is maximum legitimate organic discoverability, not a guaranteed ranking.

- Technical SEO from the beginning.
- Unique metadata per important page.
- Canonical URLs.
- Sitemap.xml and robots.txt.
- Open Graph/social metadata and custom share images.
- Structured data where appropriate and truthful.
- Indexable project/case-study pages.
- Clean semantic URLs.
- Strong internal linking.
- Fast Core Web Vitals / good mobile performance.
- Google Search Console and Bing Webmaster setup.
- Useful, original content around topics Shivam genuinely works on.
- No keyword stuffing, fake claims or spam backlinks.

18. FREE / LOW-COST PROMOTION

Use legitimate free channels to distribute real work and content: Google Search Console, Bing Webmaster, GitHub, relevant developer communities, LinkedIn, X, Instagram, YouTube and other appropriate platforms. One genuine project can be repurposed into a case study, technical post, short-form content, GitHub documentation and social distribution.

Do not use spam, fake engagement, purchased low-quality backlinks, or misleading claims.

19. RESPONSIVE DESIGN

Mobile is a designed experience, not merely a squeezed desktop layout.

- Desktop can provide richer 3D and scroll choreography.
- Mobile should simplify 3D, reduce visual density and keep interactions touch-friendly.
- All pages must remain readable and usable on small screens.

20. CODE QUALITY

- Clean, readable, human-style code.
- Avoid unnecessary abstractions and over-engineered folder structures.
- Use meaningful names; never generic names such as `data1` or `handleClick2`.
- Keep 3D/animation logic in deliberate components/hooks.

- Minimal but meaningful comments.
- Avoid AI-boilerplate repetition and generated-looking architecture.
- Prefer simple solutions unless complexity is justified.

21. CONTENT TRUTH / ZERO-HALLUCINATION PROTOCOL

This is a hard project rule for Antigravity:

- 1) Never invent personal facts.**
- 2) Never invent projects.**
- 3) Never automatically add old projects unless Shivam explicitly asks for them.**
- 4) Never invent achievements, clients, revenue, metrics, testimonials or experience.**
- 5) Never invent service offerings.**
- 6) Never invent product names, prices, features or claims.**
- 7) Never invent Personal Lab entries.**
- 8) Never assume a technology stack unless Shivam specifies or approves it.**
- 9) If a required fact is missing, ask a focused question or use a clearly marked placeholder—do not guess.**
- 10) Preserve user-provided facts exactly unless asked to rewrite them.**
- 11) Do not silently change an agreed architecture or requirement; explain the proposed change first.**
- 12) Do not claim a feature is implemented unless it has actually been implemented and verified.**

22. DECISION RULE FOR AMBIGUOUS REQUESTS

When a request is ambiguous and the choice would affect architecture, privacy, security, payment, data storage, public content, or personal facts: stop and ask Shivam. For low-risk implementation details, choose the simplest solution consistent with this document and report what was done.

23. BUILD ORDER

Recommended implementation sequence:

1. Brand + visual direction (STITCH)
2. Design system
3. Next.js foundation and routing
4. Home/About/Projects/Services/Contact
5. Store + Razorpay + verified delivery
6. Admin authentication/dashboard
7. Personal Lab
8. SEO/discovery system
9. Performance/security hardening
10. Production deployment and verification

24. SOURCE-OF-TRUTH RULE

This document describes the current project intent. Future instructions from Shivam can update it. When a later instruction explicitly changes a requirement, treat the newer instruction as the current source of truth and avoid preserving an obsolete requirement. Do not make silent assumptions when two requirements conflict.

25. WHAT ANTIGRAVITY SHOULD DO

Before implementing a major feature, understand which part of this context it affects. Keep the website coherent as one product. Prefer production-quality, maintainable implementation over quick generated code. Verify builds, types, linting, security-sensitive flows and responsive behavior instead of assuming

they work.

When presenting implementation progress, distinguish clearly between: implemented, partially implemented, planned, and blocked/missing information. Never present planned work as completed.

END OF MASTER CONTEXT

This document is intended to remain with the Antigravity project as a persistent project-context/reference file.
